DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 3, 4, 8, 10-13, 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dhote et al (5,777,356).

The Dhote et al reference teaches a method of making a ferroelectric cell on a substrate, note entire reference. On a silicon substrate a first layer is deposited onto the substrate. The material is a metal oxide. A ferroelectric single crystal is then deposited on the metal oxide electrode layer. The ferroelectric can be deposited by MOCVD, note examples. The sole difference between the instant claims and the prior art is the metal oxide layer being a perovskite. However, in the absence of unexpected

results, it would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable structure of the metal oxide in the Dhote et al reference in order to align the ferroelectric layer, noting that the reference does teach different metal oxide layers and structures.

Claims 2, 5 to 7, 9 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dhote et al (5,777,356).

The Dhote et al reference is relied on for the same reasons as stated, supra, and differs from the instant claims in the layer thickness, and material type. However, in the absence of unexpected results, it would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable thickness and materials of the structure in the Dhote et al reference in order to create the desired circuit material.
